Testimonials:

"I had the pleasure of working closely with Anmol S, and I must say that his services as a Data Analyst and Data Scientist are truly exceptional. Anmol not only possesses an impressive analytical skill set but also demonstrates an incredible knack for creative writing that adds a unique dimension to his work. What sets Anmol apart is his unwavering commitment to delivering top-notch results consistently, often well before the deadlines. His ability to craft insightful dashboards that beautifully distill complex data is truly commendable. Anmol's dedication, professionalism, and creativity make him an invaluable asset to any team or project, and I wholeheartedly recommend his services."

Atmaram P.

Power Bi Dashboard creation Sep 2023

Verified

It was a pleasure working with Anmol on our recent Machine Learning project. I found his expertise in the subject matter to be thorough and his commitment to the project commendable. The way he approached problems, and his proactive communication ensured that the project progressed smoothly. His flexibility in accommodating feedback and making necessary adjustments was truly professional. What stood out the most for me was his innovative thinking and his ability to provide solutions that were both effective and efficient. I would highly recommend Anmol to any potential clients on Upwork. His skills and dedication make him a valuable asset for any project. Looking forward to collaborating with him again in the future."

Experience :

Case Study: Predicting Customer Churn for a Telecommunications Company

Background:

A telecommunications company, ABC Telecom, was experiencing a high rate of customer churn. They were concerned about losing valuable customers and wanted to implement a predictive model to identify potential churners early on.

Objective:

The goal was to develop a machine learning model that could accurately predict which customers were likely to churn in the near future. This would allow the company to implement targeted retention strategies.

Approach:

1. Data Collection and Preprocessing:

- Obtained a dataset containing historical customer information, including demographics, usage patterns, and customer service interactions.
- Conducted data cleaning, handling missing values, and performed exploratory data analysis to understand patterns and correlations.

2. Feature Engineering:

- Engineered relevant features such as customer tenure, monthly charges, contract type, and customer feedback scores.
- Used one-hot encoding for categorical variables and standardized numerical features.

3. Model Selection and Training:

- Selected and compared various machine learning models including Logistic Regression, Random Forest, and Gradient Boosting.
- Employed techniques like cross-validation for model selection and hyperparameter tuning to improve performance.

4. Evaluation and Model Deployment:

- Evaluated models using metrics like accuracy, precision, recall, and AUC-ROC.
- Chose the best-performing model and deployed it in a production environment.

5. Results:

- Achieved an accuracy of 85%, with a precision of 78% and a recall of 82% on the validation set.
- The model successfully identified potential churners, allowing ABC Telecom to implement targeted retention campaigns.

Impact:

The implementation of the predictive churn model resulted in a 15% reduction in customer churn rate over a six-month period. This translated to a substantial increase in customer retention and revenue for ABC Telecom.

By presenting this case study on your profile, you demonstrate your proficiency in data preprocessing, feature engineering, model selection, and the ability to deliver tangible business outcomes through machine learning solutions. Remember to add any specific tools, libraries, or techniques you utilized in this project.

Pull Algorithm

Open interest is one of the key factors that drive the market so we need to analyze the open interest data daily and its correlation with respect to price movements in order to develop strategies. There are days when the market reacts fast and does not provide enough time to visit the website, pull the open interest data, and analyze it. Developed a tool that pulls the data automatically from the website into an excel sheet daily after the data on the website is updated. It is now widely used across the team

Data Scientist Professional Course & curriculum

Dec 2018 - Apr 2019 (5 months)

Have undergone training in data science which includes data exploration, data cleaning, and building predictive models using machine learning. Training also included projects on real-life data sets which were reviewed by Data Science experts.

Employment history:

Professional Freelance Data Scientist | Afcodex Pvt Ltd

August 2020 - June 2023

I'm a seasoned data scientist proficient in TensorFlow, TensorFlow Lite, TFLearn, Keras, PyTorch, fastai, and MXNet. My skills include advanced R, Python, BI tools, and AI/Big Data technologies. With expertise in image processing, speech recognition, and model development for sectors like food, healthcare, and telecom, I specialize in classification, prediction, clustering, NLP, and chatbots. I've successfully built dashboards and web apps using Flask/Django. My experience encompasses machine learning techniques (CNN, DNN, FCNN, SVN) and libraries like TensorFlow and Tesseract. I'm adept at understanding and meeting project requirements, ensuring timely delivery of high-quality products.

Freelancer | demansold Tech Pvt Ltd

July 2022 - August 2022

Data Analyst | BI Developer | HDFC

June 2023 - Present

3.

Description

Need to Analysis the data which is based on Transportation Road Network system, Either it can be Analysis based on R, Python, or Excel no limitations it can be on your willingness. Results of analysis should be based on Results or proper charts either a pie chart or bar chart (If possible).

The job needs to be finished this Sunday 5th March Max.

The data file is attached to this Job description.

The job is based on milestones with a due dates.

The following milestone needs to be matched:

- 1 - Gather all the data from all folders by Python or whatever you are comfortable.
- 2 - Follow the Folders who have CSV files Merge them by Python or R or whatever you are comfortable with.
- 3 - Analysis the data by using Python or R or whatever you are comfortable with
- 4 - Submit the analyzation of data in an excel file or in a python file. The job Manager will review Once everything will process last milestone payment is.

4.

Description

Project work. Understanding of the human factors involved in data analytics, particularly ethical considerations for stakeholders needs to be shown in the analysis by using graphs wherever necessary (atleast 3), as well as at least 1 of the following topics (preferred is ML but if Enhanced visualization is better option then its acceptable too):

- The analysis should show how the stakeholders need to be aware of what ethical implications could be caused by the information that is found or how the current identified issue affects ethically
- Atleast one of the 3 options need to be used for performing the analysis.

description

Hello everyone, for my school project, I am looking for someone who knows how to create “mode of transport prediction” using GPS coordinates and machine learning, you can find the dataset online, you can use Microsoft geolife dataset, only thing to take care of is I’m gonna get GPS coordinates every 10 minutes for my project so keep in mind that we might have to find a dataset which has 10 minutes of interval on gps logs so that would be useful to create ml model!

Description

Please see attached project overview and deliverables.

i) Analysis report is for each algorithm per dataset. For clarification, the report will have a total of 10 analyses where each dataset will have 5 analyses.

ii) Dataset1 is from

<https://www.kaggle.com/datasets/uciml/breast-cancer-wisconsin-data>

Dataset2 is from <https://www.kaggle.com/datasets/piyushagni5/white-wine-quality>

iii) The classification problem is simply breaking up the given dataset into training and testing. E.g. 70% of dataset1 is training , 30% of dataset1 is testing. This applies to dataset2.

iv) Applying cross-validation is essential for this project.

v) Google colab for coding

vi) 2 revisions for report

vii) Provide interim in-progress report (incomplete is fine) to ensure the project is in accordance to the scope, and also to allow both parties to provide suggestions for successful completion of project

9.

Description

Hello,

This job is the creation of a workflow in Knime that will get data from an XL file.

This is a first small project that could lead to more projects if outcome is good.

The current file has 5 columns, need to find the duplicates in column D.

If there are three duplicates they should be coloured in yellow and the corresponding name on the same row in column A (also a duplicate) should also be coloured in yellow. If there are four or more duplicates they should be coloured in red and the corresponding name in column A should also be coloured in red. If there are only two duplicates they should be ignored.

In addition, a list of the red and yellow names (from column A) should be added, on the same XL file but not on the same table.

End result should be the XL file with colors as described above as well as the Knime workflow, made available to me, for processing of additional similar XL files.

9.

Description

I need a presentation for an esteemed group of CEOs and senior officials. This presentation will be adversarial machine learning, with a focus on both natural language processing (NLP) and image processing. The content is derived from a Word document and three pivotal research papers. The details are as follows:

Content Overview: The presentation will integrate insights from the following papers:

"ManiGen: A Manifold Aided Black-Box Generator of Adversarial Examples",

"Adversarial NLP for Social Network Applications: Attacks, Defenses, and Research Directions", and "Adversarial Machine Learning in Text Processing: A Literature Survey", and the attached word document.

- The subject matter encompasses both NLP and image processing within the realm of adversarial machine learning.
- The audience comprises CEOs and high-ranking officials, necessitating a presentation that is both informative and accessible to non-specialists.

• you can focus only on the following content: from "ManiGen: A Manifold Aided Black-Box Generator of Adversarial Examples" the following: Introduction, background and related work, conclusion. From "Adversarial Machine Learning in Text Processing: A Literature Survey" the following: Introduction, Adversarial Training Techniques, Defense against NLP adversarial attack, summary and research trends. From "ssssss", introduction, adversarial attack, adversarial attack in NLP, defense methods in NLP, adversarial attack and defense on social media applications, and research challenges and lessons learned. And as for Word document, it must include all of it.

Design Requirements:

- A professional and engaging design that suits a corporate audience.
- Incorporation of our brand's color scheme and typography, which I will provide.
- Emphasis on visual aids like figures and diagrams to clearly represent complex data and concepts.
- Overall, the design should facilitate an engaging narrative over the course of the presentation.

Specific Elements to Include:

- An introductory slide setting the stage for adversarial machine learning in both NLP and image processing.
- Dedicated sections for each paper, highlighting crucial findings and their broader implications.
- Visual elements like charts and graphics to illustrate key points, especially where complex data is involved.
- A summarizing conclusion slide that ties together the main points and suggests future directions.
- A "Questions & Answers" slide to engage with the audience post-presentation.

Format & Accessibility:

- Preferred format: PowerPoint
- Ensure the presentation is easily editable for any necessary updates.

Timeline:

- First draft required by December 29th for review and potential revisions.
- The presentation is scheduled to last 120 minutes, so pacing and content distribution should be carefully planned.

Your expertise in design will be crucial in conveying these complex topics in a compelling and comprehensible manner. Please feel free to reach out for any clarifications or further information.

12.

Description

Project Overview

Business case overview:

You are a Marketing Analyst at P&G. You have been asked to put together a plan to optimize the summer campaign of 2025 for Venus female blades and razors.

You will have a file with multiple attributes of stores (points of sale). In 2024 P&G has run a geolocated campaign only in selected stores. For these stores, you know whether the plan was successful or not.

Successful means that they developed meaningful incremental sales. For the upcoming year, P&G wants to repeat and optimize the summer campaign: you need to use the data on all Italian stores to provide a data-based recommendation regarding the next summer campaign.

Assumptions

You can assume that each successful store generates €2.5k in incremental sales, while running a campaign in a store costs €1.5k. You can also assume that unsuccessful stores generate no incremental sales compared to normal operations.

Data to use

dataset 1: You have one dataset containing all the stores from last year ("Venus_Summer_Plan_24_activated_Stores") and information on whether the campaign was successful or not;

dataset 2: another dataset with all Italian stores ("Store feat"), which includes all available features (socio-demographics, points of interest, climate and weather, etc).

Main Deliverables

- Provide an insight-based explanation of what stores' features drive success and why.
- Present a predictive model that can recommend how many stores and which specific stores (build a list) to run the campaign to maximize profit and generate a Size of Prize estimate of such an optimized campaign, comparing it with the previous year.
- Recommend the communication activities and contents you will promote to optimize sales in the "potential" stores.

Other deliverables:

1. Recommend what additional data P&G should acquire to be able to make the prediction even better. Consider open and paid data sources. If you manage to retrieve some additional geodata you can add it and check its impact on the model.
2. Use AI capabilities (including generative AI) to recommend personalized communication content on “potential” stores. Consider leveraging geo-local information to customize the communication. Think of prompting techniques to get to these results and provide some examples.
3. Build an interactive dashboard (PowerBI) that lets the user explore and understand the “typical traits” of potential stores for incremental sales over the Italian geography.

Working Requirements

- Try different ML models and pick one.
- Keep the dashboard simple but make sure you meet the requirements.
- If you don't know something about the business, make assumptions.
- Make sure your presentation can be understood also by non-technical Marketing Managers.
- Make sure you add quality comments to your KNIME workflow. It should be self-explanatory.

Files to Deliver:

- Summary of findings and recommendations in a word file including details regarding the main and other deliverables listed above.
- KNIME workflow file with detailed comments.
- The PowerBI dashboard (.pbix) and its PDF export as attachments.
